

Comments on revised version of Landis, "Consumption Based Responsibility for Global Warming and the Distribution of Impacts of Swiss Climate Policy"

The author responded well to the two referees' comments. The text is quite improved, even if it is by adding many caveats. The results are interesting and deserve publication despite these caveats.

The author did not add a systematic multifactor analysis of households' characteristics explaining differences in consumption patterns and carbon footprints. Nevertheless, the two-by-two decomposition in Appendix B provides some indications. It does not warrant, however, the statement of "lifetime income to be the most important criterion for determining gwp" (line 469).

The introduction could be streamlined, there is quite a bit of repetition, e.g., the reference to results by Chancel et al. (2023) on page 2 and 3.

Points of detail:

- There are several references to Figure 3, in the text and more so in Appendix B, which need to be revised now that Figure 3 changed. In Appendix B, this is used to refer to the distribution of per capita GWP by a household category but for all income groups confounded. This would be useful alongside the distributions per income group in figures B1 to B3. I suggest adding this to those figures.
- I did not carry out a systematic spellcheck, but some typos sprung to my attention: "I provides" on line 213, "which" in place of "who" on line 281, "the the" on line 639, "in in" on line 950, "trasport" on line 1289, "decisesively" on line 1629, "sqewed" on line 1735, "or on a hypothetical levy" on line 1744, "transport" on line 1787, "attenuated a somewhat" on line 2115.
- It would be fair to acknowledge the referees' input in the acknowledgements.
